

Environmental policy

Interal offers sales, processing and assembly of aluminum components.

Our goal is to constantly be at the forefront when it comes to consideration of the environment, energy efficiency, reduced emissions of greenhouse gases and better utilization of natural resources - which shall permeate all parts of our business:

- When choosing our suppliers and raw materials
- Our own production and other internal processes
- At contacts with our customers and being able to offer them environmentally adapted products to the greatest extent possible

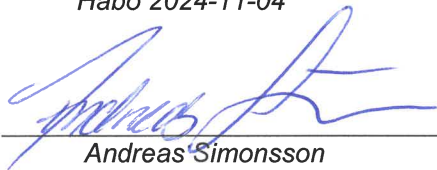

For Interal, it is a matter of course to fulfill the expectations of our customers and our surroundings, as well as complying with relevant laws and requirements. We shall work in such a way that we protect our external environment and prevent pollution of land, water and air.

Interal's most significant environmental aspect is the use of the raw material aluminum, since the production of aluminum is a very energy-intensive process. We handle this by:

- Optimizing purchases to reduce the amount of production waste
- Focusing on high quality, to reduce the amount of scrap
- Sorting of different scrap fractions to promote recycling
- Recommend aluminum with a high degree of recycled material to our customers

Interal's environmental work is actively driven by the company management, but with transparency and openness where each of the employees is encouraged to be involved.
